RESEARCH

My main research interest is the physics of magnetized plasmas around compact astrophysical objects and how it can be constrained by astrophysical observations. Specific topics include:

1. *Fluid Dynamics of Accretion Flows*: Waves and instabilities of inviscid shear flows and their role in understanding the angular momentum transport in accretion disks; Linear theory and nonlinear hydro. simulations of Rossby vortices in accretion disks. Application to star formation and supermassive black hole formation.
2. *Origin and Role of Magnetic Fields in Active Galactic Nuclei*: Galactic dynamo via star-disk collisions; MHD equilibria and formation of large scale force-free helix/jets; Magnetic fields in galaxy clusters and IGM, implications for galaxy formation.
3. *Particle Acceleration & Radiative Processes*: Stochastic particle acceleration by MHD turbulence; modeling of the time-dependent multiwavelength radiation from black hole accretion disks and AGN jets by numerically solving coupled kinetic equations for MHD waves, particles and photons; Radiative acceleration of Galactic superluminal jets.
4. *Basic Plasma Physics of Astrophysical and Space Plasmas*: Linear kinetic theory of micro-instabilities of both $e - p$ and e^\pm plasmas; Quasilinear theory of wave-particle resonant interactions; Nonlinear simulations of transit-time damping, firehose, electron beam, heat flux instabilities using Particle-in-cell and Hybrid codes.
5. *Gamma Ray Bursts*: Statistical, spatial and temporal analyses of burst data; Search for X-ray flashes from nearby galaxies; High velocity neutron star model for GRBs.
6. *Neutron Stars*: Structure of magnetosphere and relativistic pulsar winds.
